At Aesynt, we're leading the journey to perfect medication management by pioneering a new path — one that optimizes both labor and drug expenses across the enterprise for all forms of medications, allowing our healthcare partners to dramatically reduce costs and improve patient safety.

Perpetual inventory management

Aesynt's MedShelf-Rx™ is a perpetual inventory management software system that provides simple, intuitive order filling workflow for medications stored within static shelves, refrigerators, bulk storage and other non-automated locations. As medications are stocked and dispensed, inventory information is always current and accurate.

With inventory under control, MedShelf-Rx helps pharmacies meet competing goals of providing great service while reducing costs by:

- Right sizing inventory
- Increasing inventory turns
- Tracking expiration dates, leading to reduced waste
- Viewing the content and valuation of inventory at any time

Buy what you need, when you need it

MedShelf-Rx tracks non-automated inventory in your pharmacy. The inventory levels of all medications are up-to-date and known at all times. With an accurate inventory view, buyers order only what they need when they need it. No more guesswork or searching through the pharmacy to see what medications need to be ordered or ordering extra medications “just to be sure.”

Extend inventory visibility throughout the health system

Aesynt's Enterprise Medication Manager™ is the only pharmacy supply chain solution that provides the real-time ability to view and act on medication inventory and demand across every level of a health system. When bundled with Enterprise Medication Manager, MedShelf-Rx is a powerful tool for optimizing medication inventories throughout your health system:

- Reduce expired medications up to 50 percent by moving expiring medications to higher-use locations.
- Mitigate drug shortages by transferring medications from locations with abundant supply to locations in need.
- Increase inventory turns by 20 percent or more by reducing inventory of stagnant medications across the health system.
